

## TBS SYSTEM

When surface is large - one servo is never enough.  
Everybody who flies giant scale knows that.

**TBS - Timing Belt System** allows to gang two, three or virtually unlimited quantity of servos together to increase output torque on rudder or anywhere else.

**Our system is an absolutely new approach to ganging servos.**

**Tooth belt**, used in **TBS**, is very flexible & robust belt made of a special rubber and reinforced with fiber glass. This product is of a highest quality made in Germany. Obviously it speaks for itself.

**There is no need to lubricate it or to strain it.** These belts work precisely without any creeping or play transferring huge forces. The only play you have is one, which is in the servo gear. But there is nothing we can do about it yet.

**The tooth pulleys are made of a very strong and rigid fiberglass filled plastic.** The pulley can be installed on top of each other, letting you design practically any kind of configuration of the system.

**Any** brand standard servos could be installed at laser cut aluminum base.
